PORT FOLIO

2022-2026

CONTENTS

This portfolio includes five selected projects across web design, interaction design, brand identity, and book design. Together, these works explore visual storytelling, digital experience, emotional interaction, and printed communication.

EMOTICONIZED

Dislocated Emotions: The Mangafication of Feeling is a research-driven design volume that examines how emotion is visualized, codified, and mechanized in contemporary culture. Beginning with the semiotics of manga and emoji, it traces the transformation of human affect—from hand-drawn symbols and exaggerated expressions to digital reactions and algorithmic predictions. affect and emotional capitalism, where feelings become measurable, optimized, and commodified.

CONSTRUCTING THE BOOK

Concept

EMOTICONIZED explores how emotions are transformed into visual codes across manga, emoji, memes, and digital media.

The project studies how feelings are simplified, exaggerated, repeated, and eventually turned into modular symbols.

Using manga-inspired layouts, screentone textures, and hand-bound publication design, the book visualizes the tension between real emotion and symbolic expression.

It asks what happens when feelings are no longer simply experienced, but selected, designed, and circulated.

Sketches

Final Pages

Explanation

Interlude Production Explanation

Each interlude page shows the making process behind the comic panels, from rough sketches to clean linework and simple two-tone shadows. The stories follow a small witch and a tired ghost through joy, anger, sadness, and surprise, using exaggerated reactions to show how manga turns emotion into visual symbols.

Layout & Grid System Explanation

The book uses a two-column layout inspired by the vertical reading flow of manga and light novels, keeping the text and images clear and organized. Some panels intentionally break the grid by crossing columns or margins, creating a more active rhythm that reflects how emotion can disrupt order.

Cover & Binding Description

The book is hand-bound with visible thread stitching and brushed glue, allowing the spine to open fully for uninterrupted comic spreads. The raw boards, unfinished edges, and yellow thread give the book a handmade feeling while connecting its physical structure to the project's study of emotional symbols.

OUTCOME

EMOTIONAL TYPEFACE & TYPEWRITER BLENDING SYSTEM

This project explores a new form of dynamic typography using emotion detection and emotion blending.

By blending the SDF of multiple typography and controlling parameters in real time, the typeface can change its form according to emotional states. The system combines typewriter-style animations, retro pixel aesthetics, and emotion-driven shape variations to introduce a new expressive dimension to digital text.

https://chentian-lynn.github.io/emotional_typeface/

FRAMEWORK

Concept

This project explores how typing can become more emotional. Instead of using only emojis to show feelings, the system reads the user's facial expression and changes the letterforms in real time. The goal is to turn text into a responsive visual form that reflects the user's mood.

PROCESS

Sketch

Emotional Typography — Sketch Development

The process began with hand sketches on tracing paper. I used these sketches to explore how different emotions could appear in letterforms. Anger became sharp and broken, sadness became soft and melting, fear became shaky and fragmented, and happiness became round and light.

System Design

OUTCOME

Display

When users type, the text changes with their emotions in real time. Anger makes the letters sharper, sadness makes them droop, and happiness makes them feel softer and lighter. In this way, typing becomes a simple interaction where the user's feelings are reflected through the text.

Emotional Typography

The six rows of alphabets represent six core emotions mapped to typographic behaviors. From top to bottom: Disgust, Happiness, Fear, Surprise, Sadness, Anger. Each emotional state drives a unique visual transformation of the glyphs.

OUTCOME

I also included a demo video showing the system in use. The video tests the project under different lighting conditions, with different users, and through screen recordings from multiple angles.

KAOMOJI DIGITAL DICTIONARY CARDS

This project is a visual and linguistic exploration of Asian internet kaomoji, focusing on how multi-script characters ranging from Kannada and Thai to Hangul, IPA symbols, and Chinese combine to form expressive digital faces.

Each entry breaks down a kaomoji's character origins, emotional function, usage context, and cultural history. Presented through stylized graphic layouts, the project highlights how diverse writing systems shape online expression and demonstrates the rich cross-cultural evolution of internet visual language.

https://chentian-lynn.github.io/kaomoji_card/

PROCESS

Concept

The project began with research into kaomoji, emoji, and manga-style emotional symbols. I explored online examples, academic texts, and personal references such as tarot cards to understand how simple visual signs can carry emotion and meaning. Based on this research, I designed an interactive card system where users can select, inspect, flip, and browse different kaomoji cards. The process connects research and interaction: each card works like a small emotional symbol, showing both its visual form and hidden meaning.

Interaction Design

Component

This section shows early card design sketches with different layouts and decorative edges. The mix of styles reflects the varied origins and visual diversity of kaomoji.

personal experience

PROCESS

Sketch

The draft interface uses a clear grid inspired by dictionary layouts. It organizes each kaomoji with its meaning, code, and usage example.

This section shows the border sketches for the interface. The bandage shapes suggest a connection between design language and natural language, while the kaomoji and symbols add a playful card-inspired decoration.

Card Design

NAVICARE— HOSPITAL NAVIGATION APP

Design of a hospital navigation app to streamline appointment booking, wayfinding, and medical record access. The design takes into account cross-cultural differences between U.S. and Chinese hospital systems to improve usability for both contexts.

PROCESS

Design Goals

Simplify hospital visit procedures with clear navigation. Integrate appointment booking, map navigation, and quick access to prescriptions. Ensure cultural adaptability for different user expectations.

Personas Introduction

I created three representative personas to capture the main user groups of NaviCare

User Testing

During the paper prototype stage, I conducted usability testing with several participants. The testers interacted with the mockup to complete common hospital navigation tasks.

Key Feedback for Improvement:

Navigation Clarity
Task Flow
Information Hierarchy
Color & Contrast
Cultural Adaptation

Customer Journey Map

For the process flow, I selected two personas (David and Lisa) to simulate their journeys. I assumed their key steps.

Journey 2 — Parking and Payment

This journey focuses on the parking experience. It shows how users find their parking space, check parking details, and complete payment in advance through the app.

Journey 1 — First-Time Medical Visit

This journey shows how a first-time user uses the app to seek medical care. It includes discovering the app through the hospital website, exploring key features, booking an appointment, and navigating inside the hospital.

PROCESS

Visual System

This section presents NaviCare's logo, color palette, illustrations, icons, and low-fidelity wireframes. Together, these elements create a calm, clean, and user-friendly visual direction for the hospital app.

App Interface

OUTCOME

WEBSITE DESIGN

Landing Page

I designed a landing page to introduce NaviCare's main features and explain how the app helps users navigate hospital visits more easily. The page uses a clear hero section, feature highlights, and call-to-action buttons to guide users through the product quickly.
